

LONG RANGE TEAR GAS PROJECTILE

The GL-202, cal. 37/38, 38.1 and 40 mm cartridge with a long range tear gas projectile was developed for use in riot control and operations against criminal activity. The projectile is launched at average distances of 120 m, in front of or over obstacles such as: walls and barricades, with the objective of moving crowds and dispersing groups of lawbreakers via the effects of the tear gas agent.

OPERATION

It should be fired by the CONDOR AM-600 launcher or any launcher of a caliber similar to the ammunition. The greatest range is obtained by positioning the weapon at a 45° angle relative the ground. The end result is the formation of a great volume of smoke containing the tear gas agent CS (orthochlorobenzylidenemalononitrile). Do not fire directly at people, the since shot may be lethal. It may burst into flames if in contact with easily combustible materials.

GENERAL CHARACTERISTICS

The cartridge is composed of an aluminum casing and projectile, a percussion fuze, firing charge and lachrymation charge. The projectile is equipped with an orifice for the exit of the smoke containing the tear gas agent CS.

SHELF LIFE

When stored in the original package, in a cool, dry and ventilated location, kept away from walls, ceiling and the ground and protected from direct sunlight the product has a five year shelf life.

WARNING

This product can only be utilized by people who are legally qualified and trained. If employed in an inadequate manner, it can cause serious harm or death and even cause damage to property and the environment.
